

IAM Chatbot Interaction

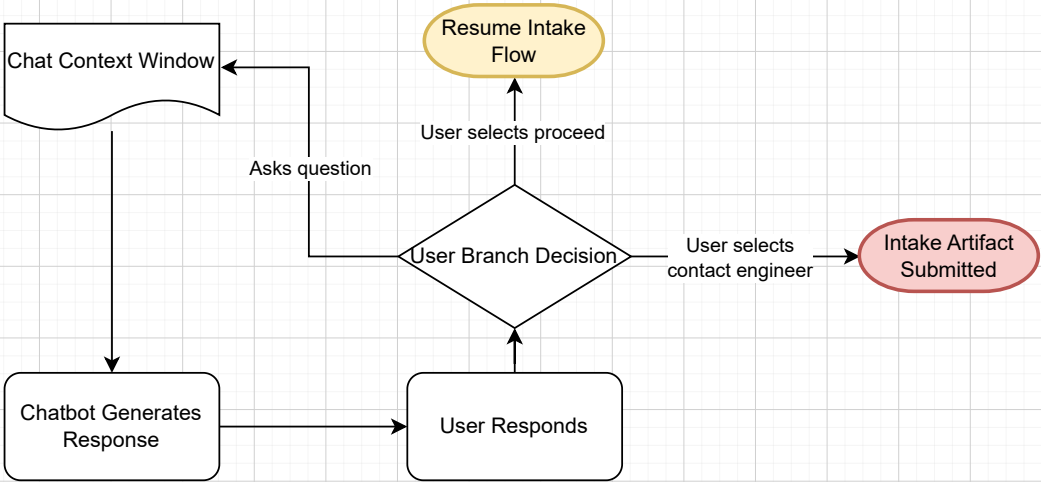

Defines the ideal interaction of a user with the chatbot's primary feature to engage customer to capture required information for an SSO integration

Chatbot Type:
Hybrid (Rule-Based + Generative)

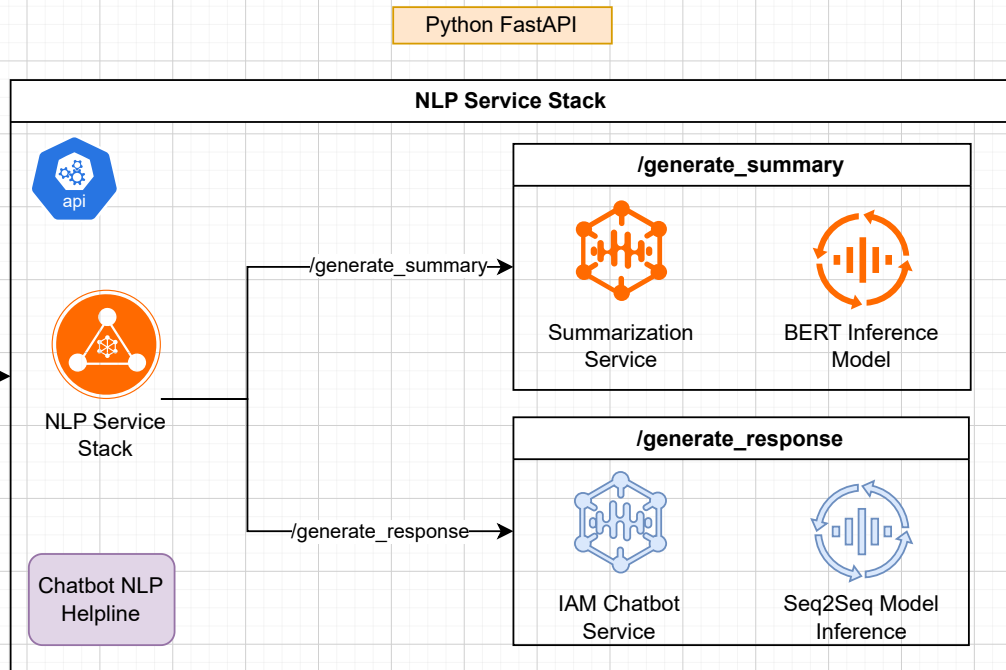

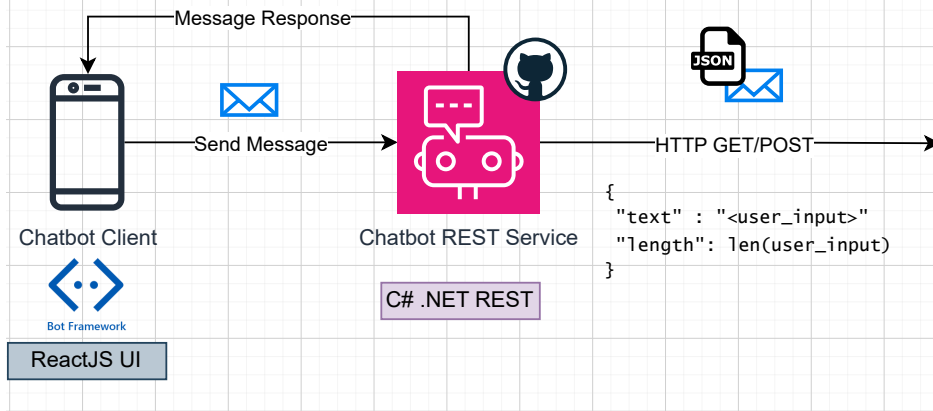

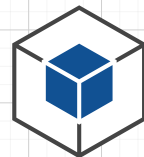

Chatbot NLP Helpline

This process utilizes **chatbot text generation** to answer questions and give related information to the user *in hope* to proceed to the next step

IAM Chatbot App Architecture

Highlights major components of the applicaiton architecture showing the connection of the client chat software, chatbot backend, and NLP microservices

IAM Chatbot Training Pipeline

Shows transformation of raw documents (PDFs, markdown files, text files) into Q/A (question/answer) pairs used for training for the Seq2Seq model.

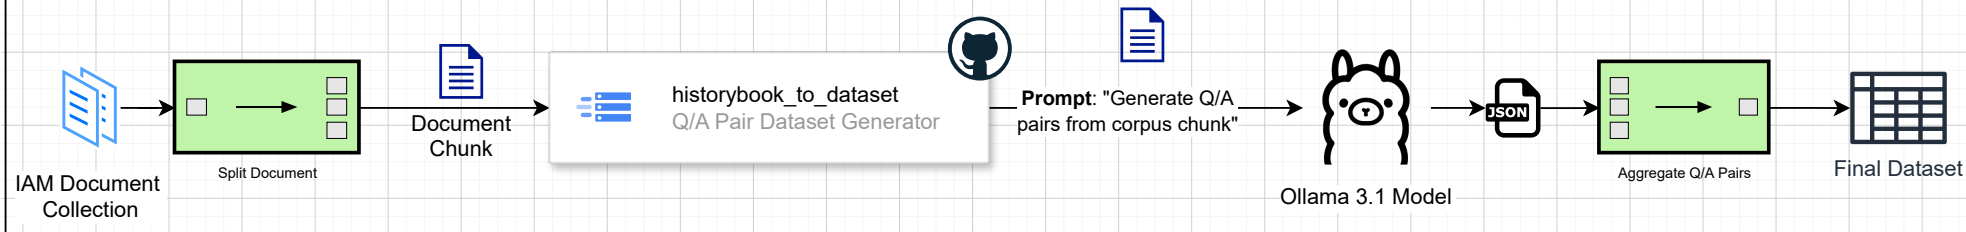

Q/A Pair Example

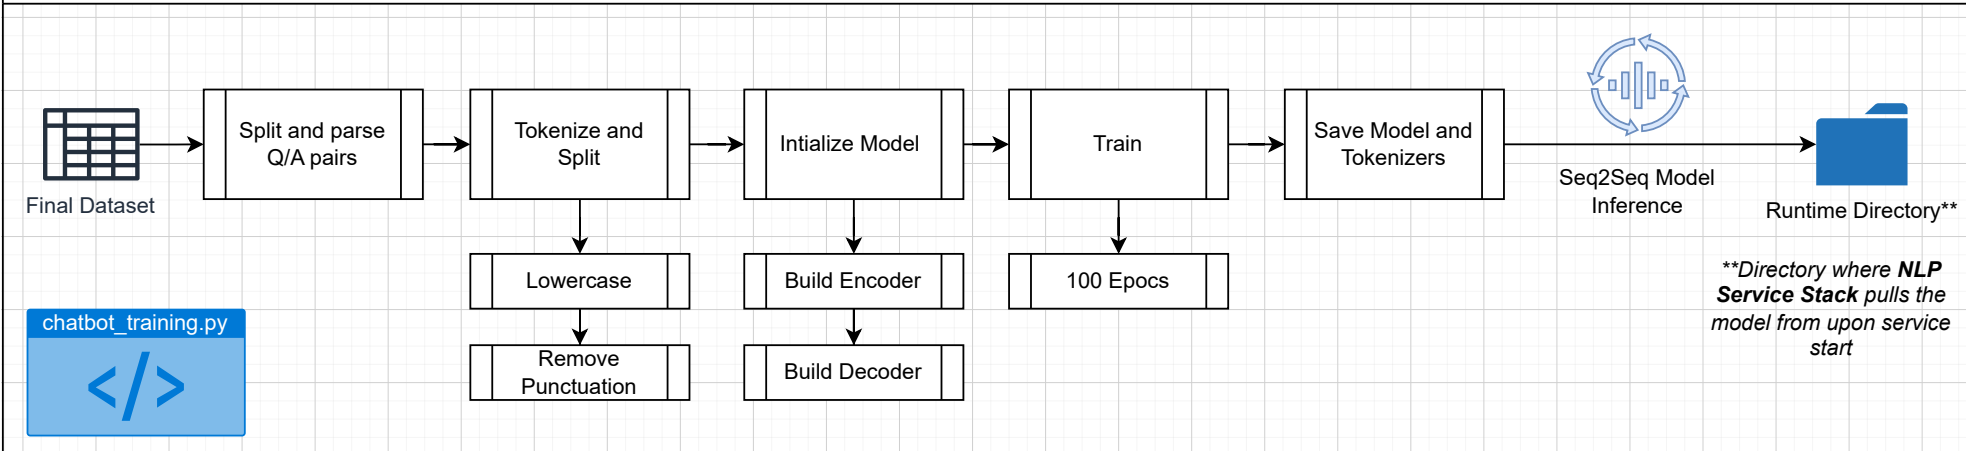

```
{  
  "instruction" : "Explain how the identity management system verifies user privilege levels."  
  "input": "The identity management system provides data from authoritative sources....."  
  "output": "the system provides data from authoritative sources to inform auditors about users."  
}
```

Dataset Preparation Pipeline

Chatbot Training Pipeline

IAM Chatbot Evaluation Pipeline

Shows how chatbot performance was evaluated based using the ROGUE metric with the dataset it was trained on.

Q/A Pair Example

```
{  
  "instruction" : "Explain how the identity management system verifies user privilege levels."  
  "input": "The identity management system provides data from authoritative sources....."  
  "output": "the system provides data from authoritative sources to inform auditors about users."  
}
```
